The Emerald Ash Borer (EAB) is a serious threat to Iowa's ash trees.

- A wood-boring beetle that kills North American Ash trees
- Destroys ash trees by tunnelling under bark
- Easily transported through infested firewood
- Could cost billions of dollars if it's spread is not controlled
- Already found in Illinois, Ohio, Indiana, Pennsylvania, Michigan and Maryland

Three Out Of Four Ain't Bad.

Every year the Emerald Ash Borer (EAB) kills thousands of ash trees.

So far they're not in Iowa. We want to keep it that way. If you've got friends coming to Iowa to spend some time outdoors, tell them to keep their bugs at home.

By the way, it is a Federal offense to bring firewood into Iowa!

Your friends can pack their guns, ammo and camo – tell them to leave their bugs, and firewood, at home.
